

- Pet urine, stain, vomit, feces, and odor removal
- Flood restoration
- Extract contaminants that have absorbed beneath carpet backing
- Flush out true source of reappearing spots and odors

## What is Sub Surface Extraction?

Sub Surface Extraction is used by professional carpet cleaners to thoroughly **remove contaminants, liquids, and odors** that have soaked into carpet padding and upholstery. Short of removing carpet, sub surface extraction is the best method for flushing out the true cause of odors and reappearing spots.

## How It Works

**STEP 1:** Saturate the affected areas with **Smiley Paws, a professional grade strength Urine, Odor, and Stain remover**. Allow the cleaning solution to seep deep into the carpet's backing, padding, and subfloor, in order to target the entire odor source. The solution will work to rehydrate, emulsify, and break down organic soil and pet urine solids in preparation for extraction and rinsing.

**STEP 2:** Finish by using the the **SOS Tool** or the **SOS PRO** with an extractor or truckmount or wet-and-dry vacuum to flush out the solution and contaminants from the carpet.
